

Max of a list

Write a function which takes a list as an input from the user [using the input() command] and returns the highest and the second highest elements of a list.

Ex:

Input 1:

1 2 3 4

Output 1:

3 4

Input 2:

1 2 3 8 7

Output 2:

7 8

Max of a list - 2

Write a function called MaxSeq() which can take any number of inputs from the user and returns the highest number in that sequence as the output.

[You cannot use the inbuilt function max() of python]

Ex:

Input 1:

11 2 3 4

Output 1:

11

Input 2:

1 2 3 8 7

Output 2:

8
