

Using the position property, create a Navbar and a Footer which is always visible to the end user. See below for an example:

Use this link <https://gifyu.com/image/ZF5J> to see it in action.

Note:

- Use semantic tags like header, footer and nav.
- The content inside header and footer is NOT important. However, you should put enough dummy content in your page so that the page becomes scrollable and the fixed navbar and footer effect can be shown.
- No inline/embedded styles.
